

South 40 Solar

## The Fencepost Solar Mounting System™

### *Affordable.*

Although solar equipment costs have plummeted, mounting methods have kept the installed system price out of reach.

Until now. The elegantly simple Fencepost Solar Mounting System eliminates expensive racking and roof mounting, and it features cost-effective and readily available treated lumber, concrete, and galvanized steel hardware.

### *Flexible.*

The low-profile design of the Fencepost Solar Mounting System needs sunny space on the ground. Place your solar panels for optimal sun exposure to maximize your electricity production, not limited by the size and angles of your rooftop. Run one long string of solar panels along a fenceline, or arrange them in rows – it's your choice.

During winter months, brush the snow off easily.

### *Sustainable.*

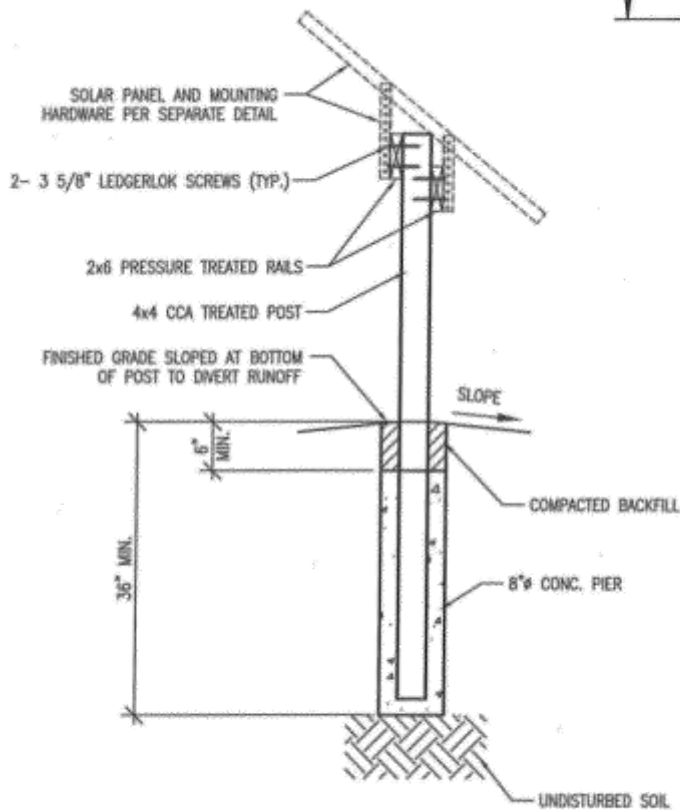

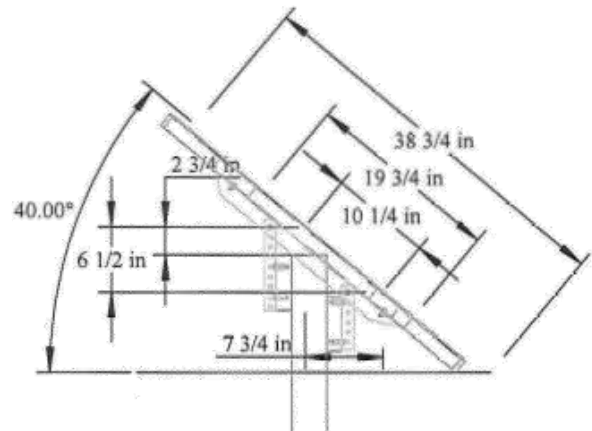

Wood is the most sustainable material available. The posts of the Fencepost Solar Mounting System are rated for ground contact, pressure-treated to protect from rot, decay, and insects. Hot-dip galvanized steel is maintenance-free and 100% recyclable. Concrete is made from limestone, the most abundant mineral on earth, and will not rot, rust, or burn.
